## ALGEBRA QUALIFYING EXAMINATION

Do either one of $n A$ or $n B$ for $1 \leq n \leq 5$. Justify all your answers. Say what you mean, mean what you say.

1A. Let $A$ be an $n \times n$ real skew-symmetric matrix.
i) Prove that the nonzero eigenvalues of $A$ are purely imaginary.
ii) Prove that $\operatorname{det}\left(A+I_{n}\right) \geq 1$.

1B. Let $F$ be a field, and let $M_{n}(F)$ denote the ring of $n$-by- $n$ matrices in $F$. Let $A \in$ $M_{n}(F)$ with minimal polynomial equal to its characteristic polynomial. Suppose that $B \in M_{n}(F)$ commutes with $A$. Show that $B=f(A)$ for some $f \in F[x]$.

2 A. Prove that a finite simple group of even order is generated by elements of order 2 .
2B. Show that all groups of order $5 \cdot 7 \cdot 73$ are cyclic.

3B. Consider the ring $R=\mathbb{Z}[x] /\left(x^{2}\right)$.
i) Show that every ideal of $R$ can be generated by two or fewer elements.
ii) Show that $(x)$ is the only prime ideal of $R$ that is not maximal.

4A. Let $p_{1}<p_{2}<\cdots<p_{r}$ be positive prime numbers for some $r \geq 1$, and let $K$ be the field extension of $\mathbb{Q}$ obtained by adjoining $\sqrt{p_{i}}$ for $1 \leq i \leq r$.
i) Prove that $K$ is a Galois extension of $\mathbb{Q}$ with $\operatorname{Gal}(K / \mathbb{Q})$ an elementary abelian 2-group.
ii) If $E \subset K$ is a subfield of $K$ of degree 2 over $\mathbb{Q}$, prove that $E=\mathbb{Q}(\sqrt{m})$ for some $m$ that is the product of all elements in a subset of $\left\{p_{1}, p_{2}, \ldots, p_{r}\right\}$.

4B. Let $p$ be a prime, and let $F$ be a field of characteristic not equal to $p$. Suppose that $F$ contains a nontrivial $p$ th root of unity, and let $a \in F^{\times}$.
i) Show that $a$ is a $p$ th power in $F^{\times}$if and only if $x^{p}-a$ is reducible in $F[x]$.
ii) Let $E$ be the splitting field of $x^{p}-a$, and suppose that $a$ is not a $p$ th power in $F^{\times}$. Determine $\operatorname{Gal}(E / F)$ up to isomorphism.

5A. Let $R$ be a ring with unity. Let $M$ be a left $R$-module in which the chains of distinct left $R$-submodules are of finite and bounded length. Let $f: M \rightarrow M$ be a left $R$ module endomorphism. Show that there exist $f$-stable left $R$-submodules $U$ and $N$ of $M$ with $M=N \oplus U$ such that $f$ restricts to an isomorphism of $U$ and $f$ restricts to a nilpotent endomorphism of $N$ (i.e., $f^{k}(N)=0$ for $k$ sufficiently large).

5B. Let $f \in \mathbb{Q}[x]$ be a polynomial of degree $n \geq 1$ with exactly $r$ real roots in $\mathbb{C}$.
i) Show that $f$ factors in $\mathbb{R}[x]$ as a product of $r$ linear and $(n-r) / 2$ quadratic polynomials. (You may use the fundamental theorem of algebra.)
ii) Let $K=\mathbb{Q}[x] /(f)$. Show that

$$
\mathbb{R} \otimes_{\mathbb{Q}} K \cong \mathbb{R}^{r} \times \mathbb{C}^{(n r) / 2}
$$
