

A scaling limit in a system of particles

Prof Sunder Sethuraman

Abstract: We begin with a brief discussion of probability research. Then, we focus on a type of particle system which models `traffic'. A question is how to understand the particle mass in the system in different scales, e.g. street level versus what a bird might see. We state that types of pde's can be derived to describe the continuum mass flows. We end with some open directions.
